Kalpa Health Brief A: Growth H1 2025 vs H1 2026

Oct 22, 2026 · @Kshitij

Headline

Test results grew 5.75% from H1 2025 to H1 2026 (357,769 to 378,358 rows), driven by a shift from clinic to home collection and by package tests.

- **Channel:** home results grew 37.7% (+13.5 pp of total growth) while clinic results fell 12.1% (−7.7 pp). This happens in every city.
- **Packages:** package share of results rose from about 12.5% to 15.9% in both channels, adding 4.4 pp of growth. Non-package tests grew only 1.6%.
- **Cities:** Jaipur (−9.9%) and Chennai (+1.3%) trail the other four cities (+9.2% combined) because they have fewer patients. Their gap was already visible in January.

The channel and package contributions overlap, so they do not add up to 5.75 pp together. Each set sums to the total on its own.

Growth tree

Most of the growth is more patients (+3.8%), with a small rise in tests per visit and a slight fall in visits per patient.

Results = patients × visits per patient × tests per visit × results per test booked. A visit is a booking, and rescheduled duplicate bookings are removed because they never get results. The four branches multiply back to the actual growth with a gap of 0.

Branch	Growth H1 2025 to H1 2026
Patients (unique patient IDs)	+3.76%
Visits per patient	−0.98%
Tests per visit	+2.19%
Results per test booked	+0.72%
Product of the four branches	+5.75%

Branch	Growth H1 2025 to H1 2026
Actual growth in results	+5.75%

Channel shift

Home collection grew 37.7% and clinic fell 12.1%, a shift seen in every city; the data cannot say why it happened.

Channel (growth %)	Patients	Visits per patient	Tests per visit	Results per test booked	Results	Contribution to total (pp)
Home	+26.25	+6.83	+1.89	+0.17	+37.66	+13.46
Clinic	−8.28	−6.08	+2.35	−0.34	−12.14	−7.74

Results with no matching booking (1,798 in 2025, 1,922 in 2026) have no channel and add +0.03 pp, which brings the total to 5.75 pp. A patient who uses both channels counts in both, so channel patient counts do not add up to the total.

Results growth by city and channel:

City	Clinic results (%)	Home results (%)
Ahmedabad	−6.55	+41.72
Bengaluru	−9.66	+42.00
Chennai	−16.01	+32.68
Hyderabad	−10.44	+40.74
Jaipur	−25.15	+17.76
Pune	−10.42	+42.78

Jaipur and Chennai have the weakest home growth and the steepest clinic decline.

Packages

Package tests (PK01 to PK04) grew 35.2% (44,467 to 60,110 rows) while all other tests grew 1.6% (313,302 to 318,248), and their share of results rose by about 3.5 points in both channels.

Channel	Package share 2025	Package share 2026	Package rows	Non-package rows
Clinic	12.4%	15.9%	+12.6%	−15.6%
Home	12.5%	15.9%	+75.3%	+32.3%

Packages are not a home-only effect. They grew more in count at home (about 12,000 of the 15,600 added package rows) because the home channel itself grew. In clinic, packages (+3,571 rows) partly offset a fall in other tests (−31,256 rows).

A package is one row in the results table. If a package bundles several tests, counting result rows understates test volume. We have no package composition table, so the headline counts result rows.

Jaipur and Chennai

Jaipur (−9.9%) and Chennai (+1.3%) lag because they have fewer patients, not because of visit frequency, tests per visit or lab fulfilment.

City (growth %)	Patients	Visits per patient	Tests per visit	Results per test booked	Results
Ahmedabad	+9.70	−1.04	+1.88	+0.36	+11.00
Bengaluru	+7.10	−2.26	+2.78	+1.22	+8.90
Chennai	−4.95	+3.13	+2.73	+0.62	+1.33
Hyderabad	+8.10	−2.46	+1.88	+0.50	+7.96
Jaipur	−12.08	−0.24	+1.73	+0.98	−9.89
Pune	+8.84	−2.27	+1.65	+0.59	+8.75

These two cities changed booking software from April 2026 (the first new-format bookings were created in March). Four checks suggest the change is not the main cause of the shortfall:

- The gap was already there in January 2026 (−0.2% results growth against +9.5% for the other four cities), before any new-format booking appears.

- Patient ID format is identical in both years and in every city (four letters plus seven digits).
- The share of 2026 patients who also booked in H1 2025 is higher in Jaipur (37.4%) and Chennai (35.8%) than elsewhere (about 30%). Re-issued IDs would push it lower; fewer new patients pushes it higher.
- After removing rescheduled duplicate bookings, results per test booked is 0.82 to 0.83 in every city, so the new software is not losing results.

The data shows where the shortfall sits, not why. The returning-patient check only covers H1 2025.

Data cleaning and caveats

Test volume is counted from the results tables (357,769 rows in H1 2025, 378,358 in H1 2026), built from six city files for January to June. All cleaning is in one script, kalpa_clean.py.

Cleaning steps

1. Removed repeated header rows from the bookings tables (7 in 2025, 8 in 2026). The results tables had none.
2. Parsed two timestamp formats (ISO with a +05:30 offset, and day-first dd/mm/yyyy HH:MM). Reading them as one format moved about 78,000 bookings into July to December.
3. Expanded the new-software bookings (Jaipur and Chennai) from one row per booking, with tests in a nested list, to one row per test. The nested patient field was split into a patient ID.
4. Recovered 2,108 null test codes (1,019 in 2025, 1,089 in 2026) from the booking, only where one null row and one unmatched booked test existed.
5. Renamed Bangalore to Bengaluru, and assigned city to results with no matching booking from the booking ID prefix.
6. Removed rescheduled duplicate bookings (new software only, 1,500 bookings) before computing visits and tests per visit. They get a new ID that never has results.

Caveats

- 94 results (34 in 2025, 60 in 2026) have no recoverable test code. They stay in totals and are labelled UNKNOWN.

- 3,720 results (about 0.5%) have no matching booking, so they have no channel. Whether they are missing bookings or a separate record series is unknown.
- About 0.5% of results have a July or December result date. They stay in each H1 file. Dropping them leaves growth at +5.75%.
- Volume counts result rows, so a package counts as one test.
